

WEEK 1 – STAKEHOLDER ANALYSIS

End-to-End Salesforce CRM Transformation for Customer Operations and Service Management

1.1 Project Charter

1.1.1 Project Overview

GreenGrid Utilities is a medium-sized utility and energy service provider currently facing operational challenges caused by disconnected systems and inefficient processes. The company depends on various legacy applications, manual procedures, and independent spreadsheets to manage customer information, service activities, and field operations.

As a result, important data is scattered across multiple sources, creating duplicate records, slowing down service resolution processes, and limiting management's ability to monitor performance in real time. To overcome these challenges, GreenGrid Utilities plans to implement Salesforce as a centralized Customer Relationship Management (CRM) platform. The new system will consolidate customer management, support operations, and field service activities into a single integrated environment, providing a reliable and consistent source of information.

1.1.2 Problem Statement

GreenGrid Utilities currently operates within an environment where departments work through separate systems with limited connectivity. Customer information is stored in multiple locations, resulting in duplicated records and inconsistent data quality. Communication between customer service teams and field personnel relies heavily on manual coordination, while leadership lacks immediate access to accurate operational insights and performance indicators.

Without an integrated CRM solution, the organization faces difficulties in delivering responsive, efficient, and high-quality customer service across its operations.

1.1.3 Project Scope

To maintain effective project governance and ensure successful implementation, the scope of this initiative is clearly defined. Historical and operational data from existing systems will be consolidated and migrated into Salesforce using standard data migration tools.

In Scope

- Centralized management of customer information and profiles
- Sales activity and customer relationship management
- Customer service case management and support processes
- Field service scheduling and technician coordination

Out of Scope

- Financial systems and billing applications
- Real-time integrations with external third-party platforms
- Customer self-service portals
- Development of custom mobile applications

1.2 Stakeholder Identification

Stakeholders are individuals, teams, or groups that either contribute to the project or are affected by the implementation of the Salesforce CRM solution. Identifying stakeholders helps ensure that business requirements are accurately captured and project expectations are effectively managed.

1.2.1 Internal Stakeholders

Executive Management

Senior leaders responsible for strategic planning and organizational performance. They require accurate reporting and visibility into operational activities.

Customer Support Team

Employees responsible for handling customer inquiries, complaints, and service requests on a daily basis.

Field Technicians

Technical personnel who perform maintenance, inspections, and service activities in the field.

Sales Team

Business representatives focused on customer acquisition, account management, and relationship development.

IT / System Administrators

Technical professionals responsible for system maintenance, platform configuration, and overall technology support.

1.2.2 External Stakeholders

Customers

Individuals and organizations that receive utility services from GreenGrid Utilities and are directly affected by service quality and responsiveness.

Each stakeholder group has unique objectives, responsibilities, and expectations that must be considered throughout the CRM implementation process.

1.3 Stakeholder Analysis Matrix

The Stakeholder Analysis Matrix is used to evaluate stakeholders according to their level of influence over the project and their degree of interest in its outcomes. This assessment helps determine the most appropriate engagement strategy for each stakeholder group.

Stakeholder Group	Organizational Role	Interest Level	Power Level	Key Expectations and Concerns
Executive Management	Strategic leaders and project sponsors	High	High	Access to real-time reporting, performance monitoring, and data-driven decision making
Customer Support Team	Customer service representatives	High	Medium	Faster access to customer information and simplified case management processes
Field Technicians	Operational field personnel	High	Medium	Accurate work assignments, location information, and reduced administrative workload
Sales Team	Customer acquisition and account managers	High	Medium	Comprehensive customer records and improved relationship tracking
IT / System Administrators	Platform management and technical support	Medium	High	Scalable architecture, process automation, and secure system configuration
Customers	Utility service recipients	High	Low	Faster issue resolution and improved service experience

1.4 Business Objectives Definition

1.4.1 Business Objectives

a. Improve Customer Service Efficiency

Enhance support operations by reducing the time required to access customer information and process service requests.

b. Strengthen Data Quality and Consistency

Create a centralized data structure within Salesforce to eliminate duplicate records and improve information accuracy.

c. Increase Operational Visibility

Provide management teams with real-time insights and performance indicators through Salesforce reporting and dashboard capabilities.

d. Enhance Collaboration Across Departments

Enable seamless communication and coordination between customer service teams and field service personnel through a unified platform.

1.4.2 Success Metrics

a. Reduction in Average Handling Time (AHT)

A measurable decrease in the time customer support agents spend processing service requests.

b. Reduction in Duplicate Records

A significant decline in duplicated customer and contact information within the system.

c. Dashboard Adoption and Usage

Consistent utilization of reports and dashboards by management for monitoring operational performance.

Conclusion

This stakeholder analysis provides a comprehensive overview of the individuals and groups involved in the Salesforce CRM transformation initiative. It identifies their influence, expectations, and project involvement while establishing clear business objectives that will guide future solution design activities.

Ensuring alignment between stakeholder requirements and organizational goals is critical to delivering a Salesforce solution that generates measurable business value and supports long-term operational success.
